## Abstract of DE3821408

In the case of a drip pan for mineral oil and petrol pumps, the pan (1), which is arranged between the pump (2) and the assembly frame (5) and is essentially equal in size to the horizontal projection of the pump, is arranged so as to lie with its entire height across the petrol pump island. In addition, the outlet aperture (21) in the pan wall (14) is provided so it is essentially aligned with the pan floor (18), so that when drips occur, the resulting liquid flows out of the collecting pan (1) on both sides onto the surface of the petrol pump island and can therefore be immediately detected and removed.
